

Hope Artificial Intelligence

Scenario Based Learning

A company works with number of employees, all the works are dependents on the employees. Even if one of the employees resign the job immediately then assigned work will be not finished at the time, so delivery of the project to the clients will be delayed. Company planned to make solution for this, they want to know which employee may resign next. If they know previously, they can arrange alternative to avoid such problem. As an AI Engineer you must give Solution to this.

A) How will you achieve this in AI?

We collect historical data of employees who have already resigned, analyze it, and prepare a numerical database for the AI model. Since the input data is numeric, we use Machine Learning. Based on historical data, we aim to predict which employees may resign in the future, thereby achieving an AI-based prediction system. For example, in the dataset below, employees who are over 30 years old and have more than 3 years of experience been more likely to resign.

B) Find out the 3 -Stage of Problem Identification

Machine Learning ->Supervised Learning -> Classification

C) Name the project

Identify who is going to resign Next - Resignation Risk Detector

D) Create the dummy Dataset.

Employee Id	Age	Salary	Experience	Resign/Work
E1	35	1,00,000	10	Resign
E2	23	10,000	1	Work
E3	29	700,000	4	Resign
E4	33	90000	9	Resign
